PROFILE

Trained in systems integration, I now automate the software delivery chain from commit to alert. Two years spent guaranteeing the availability and recoverability of production SQL Server databases taught me to design around failure modes first. I have built and operated a complete AWS stack on my own, covering Terraform, ECS Fargate, Lambda and CloudWatch. Certified STACKIT Cloud Engineer at Schwarz Digits. My method: measure rather than assume, and make every change reproducible and reversible.

TECHNICAL SKILLS

DevOps and Cloud

CI/CD	GitHub Actions, GitLab CI, GHCR, rulesets and blocking checks
Containers	Docker, Docker Compose, ECS Fargate
Orchestration	Kubernetes: declarative manifests, Deployments and ReplicaSets, Services, rolling updates and rollback
Infrastructure as Code	Terraform: remote state, modules, controlled plan and apply
Configuration management	Ansible: reusable roles, Jinja2 templates, handlers, ansible-vault
AWS	IAM, S3, Lambda, EventBridge, SSM Parameter Store, CloudWatch, ECS, VPC, ALB
Observability	CloudWatch (metrics, alarms, logs), SNS
Security	gitleaks, secret scanning, least privilege, encryption at rest and in transit

Development and databases

Languages	JavaScript and TypeScript, SQL and T-SQL, Bash
Frameworks and databases	Node.js, Express, Next.js, PostgreSQL, Microsoft SQL Server
Quality	Unit and integration tests, post-deployment smoke tests
Tooling	Git, GitHub CLI, kubectl, kind, actionlint, hadolint, ansible-lint, AWS CLI, psql

PROFESSIONAL EXPERIENCE

Website rebuild and deployment automation

March 2026

Schmidszaunbau, freelance assignment, Hamburg. Bash, rsync over SSH, PHP, STRATO shared hosting

- Manual FTP deployment replaced by a Bash pipeline using rsync over SSH: dry-run mode, configuration through environment variables, SSH key injection.
- Automated verification after every release through curl smoke tests, checking the content actually served in production in German and English as well as the HTTP status of the API endpoint, with an explicit failure on regression.

- Identified the docroot genuinely being served among four duplicated directories on an undocumented legacy infrastructure, by correlating HTTP Last-Modified headers with server mtimes. Environment recorded in a runbook.
- Third-party form service replaced by a self-hosted PHP backend: input validation, protection against SMTP header injection, spam honeypot, send fallback and failure logging.
- Systematic timestamped backups before any change in production, guaranteeing immediate rollback.

SQL Server Database Administrator

May 2023 – February 2025

GDE Solution GmbH, freelance assignment, Eberdingen

- Security and access: accounts, roles and permissions managed on the least privilege principle, data encryption at rest through TDE and in transit, compliance audits and detection of unauthorised access.
- Backup and disaster recovery: automated Full, Differential and Transaction Log strategies, restore procedures tested regularly to validate data consistency and RTO and RPO targets, high availability through AlwaysOn Availability Groups, Failover Cluster Instances and Log Shipping.
- Performance tuning: analysis of system metrics (CPU, memory, disk I/O, locks and deadlocks), slow T-SQL queries identified and optimised through indexing, rewriting and statistics updates, automated preventive maintenance through index rebuilds and DBCC CHECKDB.
- Installation and maintenance: deployment and configuration of instances both on-premises and on cloud virtual machines, Cumulative Updates and Service Packs, version upgrades and migrations, capacity planning to anticipate data growth.

DevOps Engineer, industrial systems and IoT

July 2021 – February 2022

High Tech Industry, Odessa, Ukraine

- Continuous delivery pipelines on GitLab CI and GitHub Actions, shipping code securely to local servers, IoT gateways and programmable logic controllers.
- Automatic alerting on loss of connection to a network gateway or signs of failure in an industrial control system.
- Terraform infrastructure as code for the servers, databases and networks hosting industrial reports and energy consumption history.
- Interface between development and the shop floor: automation of software tests together with electrical engineers and PLC programmers, ahead of physical installation in control cabinets.

PERSONAL PROJECTS

MyMifa, job application tracking app

February 2025 – present

Application in production. Next.js, Express, PostgreSQL, Terraform, AWS

A complete DevOps chain built on a production application, from commit to alert.

- CI/CD pipeline with six blocking checks: lint, unit tests, image build, schema rebuild, validation of workflows and Terraform code. No direct push to main.
- Terraform infrastructure as code on AWS: encrypted and locked remote state in S3, IAM roles on least privilege, secrets isolated in SSM Parameter Store.
- API containerised as a non-root user, reproducible local environment with Docker Compose and PostgreSQL 18.
- Failing GitHub Actions cron diagnosed by measurement and replaced with EventBridge Scheduler and Lambda: 19 daily executions observed instead of the 96 configured, replacement chain in place within 15 minutes.
- Containerised deployment on ECS Fargate behind an ALB: VPC, subnets across two availability zones, security groups by cross-reference. Ephemeral environment driven by Terraform, built, validated, documented and then torn down.
- CloudWatch monitoring covering two distinct failure modes: the function fails, and the function no longer runs at all.
- Three production bugs caught by tooling rather than by code review.

Ansible, Kubernetes with kind, Linux

Ansible, Linux server configuration

- Reusable role deploying and configuring nginx idempotently across a fleet of servers: Jinja2 templates driven by facts, handlers triggered only on actual change, loops and conditionals on system variables, command of the variable precedence hierarchy.
- Encrypted secrets through ansible-vault, with non-interactive execution suited to automation.
- Systematic validation in check mode with diff before any application to targets. Code compliant with ansible-lint in the production profile.

Kubernetes, local multi-node cluster with kind

- Deployment through declarative manifests: Deployments and ReplicaSets, Pod scheduling, coupling via labels and selectors.
- Internal exposure through ClusterIP Services, with internal DNS resolution and load balancing across Pods.
- Command of the version lifecycle: progressive rolling updates and rollback to an earlier revision.

CERTIFICATIONS AND CONTINUING EDUCATION

STACKIT University, Schwarz Digits, Neckarsulm — March 2026

Certified STACKIT Cloud Engineer, STACKIT Product Fundamentals, DevOps Fundamentals, Terraform Fundamentals, Cloud Foundry Fundamentals, Deploying an Application with STACKIT Kubernetes Engine, Kubernetes Fundamentals, Docker Fundamentals, Linux Fundamentals.

AI Fluency: Framework and Foundations, Anthropic — 2026

Certificate issued in partnership with University College Cork, Ringling College of Art and Design, Higher Education Authority and National Forum.

Microsoft SQL Server Administration, KiawiTechIT Academy — October 2022 to January 2023

Training programme of more than 600 hours.

German language certificate, level B1, Anglo-German Institut, Stuttgart — June to November 2022

EDUCATION

Obtained 2020 Bachelor's degree in Banking and Finance, University of Dschang, Cameroon

Obtained 2019 IT specialist in systems integration, Fachinformatiker Systemintegration, Collège de la Salle, Douala, Cameroon

LANGUAGES

French	Native speaker
German	B1 certificate 2022, current level B2
English	Fluent

INTERESTS

Football with SV Rot 1945 and Camas e.V., African and international cooking, travel, reading and research on entrepreneurship, artificial intelligence and cloud computing.
